

OUR BUSINESS

Weyerhaeuser Company is one of the world's largest private owners of timberlands. We own or control more than 10 million acres of timberlands in the U.S. and manage long-term licenses covering more than 14 million acres in Canada. We manage these timberlands on a sustainable basis in compliance with internationally recognized forestry standards. Our objective is to maximize the long-term value of timberlands we own. We analyze each timberland acre comprehensively to understand its highest-value use. We realize this value in many ways, most notably through growing and harvesting the trees, but also by selling properties when we can create incremental value. In addition, we focus on opportunities to realize value through lease and royalty agreements for the surface and subsurface rights that exist in our ownership, including through our Climate Solutions business.

We are also one of the largest manufacturers of wood products in North America. We manufacture and distribute high-quality wood products, including structural lumber, oriented strand board, engineered wood products and other specialty products. These products are primarily supplied to the residential, multi-family, repair and remodel, industrial and light commercial markets. We operate 33 manufacturing facilities in the United States and Canada.

Sustainability and citizenship are part of our core values. In addition to practicing sustainable forestry, we focus on energy and resource efficiency, reducing greenhouse gas emissions, conserving natural resources and offering sustainable products that meet our customers' needs. Our sustainably managed forests and our wood products play a critical role in mitigating climate change, and we remove substantially more carbon than we emit each year. We outperform national industry safety rates, actively support the communities in which we operate and communicate transparently with our investors and other stakeholders. We are recognized for our leading performance in the areas of ethics, citizenship and gender equality.

This portion of our Annual Report on Form 10-K provides detailed information about who we are and what we do. Unless otherwise specified, current information reported in this Form 10-K is as of or for the fiscal year ended December 31, 2025. Throughout this Form 10-K, unless specified otherwise, references to "we," "our," "us" and "the company" refer to the consolidated company. We break out financial information such as revenues, earnings and assets by the business segments that comprise our company. We also discuss the geographic areas where we do business.

WE CAN TELL YOU MORE

AVAILABLE INFORMATION

We meet the information reporting requirements of the Securities Exchange Act of 1934 by filing periodic reports (annual reports on Form 10-K, quarterly reports on Form 10-Q), current reports on Form 8-K, proxy statements and other information with the Securities and Exchange Commission (SEC). These reports and statements, which contain information about our business, financial results, corporate governance and other matters, as well as amendments to these reports and statements, are available at:

- the SEC website — www.sec.gov and
- our website (free of charge) — www.weyerhaeuser.com.

When we file or furnish information electronically with the SEC, it is also posted to our website.

WHO WE ARE

We were incorporated as Weyerhaeuser Timber Company in the state of Washington in January 1900, when Frederick Weyerhaeuser and 15 partners bought 900 thousand acres of timberland. Today, we are working to be the world's premier timber, land and forest products company for our shareholders, customers and employees.

REAL ESTATE INVESTMENT TRUST (REIT)

Weyerhaeuser Company qualifies as a REIT under the Internal Revenue Code of 1986, as amended (IRC), and REIT income can be distributed to shareholders without first paying corporate level tax, which substantially eliminates the double taxation of income. We own a substantial amount of our timberland assets through two subsidiaries: Weyerhaeuser Timber Holdings, Inc., which holds our western timberland assets and began qualifying as a REIT beginning in the tax year 2022; and Weyerhaeuser Forest Holdings, Inc., which holds our southern timberland assets and began qualifying as a REIT beginning in the tax year 2025. We expect to derive most of our REIT income from our timberlands, including gains from the sales of our standing timber and rent from recreational leases. We are required to pay federal corporate income taxes on earnings of our Taxable REIT Subsidiaries (TRSs), which include our Wood Products segment and a portion of our Timberlands and Real Estate, Energy and Natural Resources segments.

OUR BUSINESS SEGMENTS

In our *Management's Discussion and Analysis of Financial Condition and Results of Operations (MD&A)* section you will find discussion of our overall performance results for our business segments, which are as follows:

- Timberlands;
- Real Estate, Energy and Natural Resources (Real Estate & ENR) and
- Wood Products.

Detailed financial information about our business segments and our geographic locations is provided in *Note 2: Business Segments* and *Note 19: Geographic Areas*. Beginning in the first quarter of 2026, the Real Estate, Energy and Natural Resources (Real Estate & ENR) segment will be renamed Strategic Land Solutions. The segment will include the following businesses: Real Estate, Natural Resources and Climate Solutions.

EFFECT OF MARKET CONDITIONS

The health of the U.S. housing market strongly affects the performance of all our business segments. Our Wood Products segment primarily sells into the new residential building and repair and remodel markets. Demand for sawlogs within our Timberlands segment is directly affected by domestic production of wood-based building products as well as export markets. Seasonal weather patterns impact the level of construction activity in the U.S., generally characterized by a reduction in activity during the winter months, which in turn affects the demand for our logs and wood products. Our Real Estate & ENR segment is affected by a variety of factors, including the general state of the economy, local real estate market conditions, the level of construction activity in the U.S. and the evolution of emerging renewable energy and carbon-related markets.

COMPETITION IN OUR MARKETS

We operate in highly competitive domestic and foreign markets, with numerous companies selling similar products. Many of our products also face competition from substitutes for wood products. We compete in our markets primarily through product quality, service levels and price.

Our business segments' competitive strategies are as follows:

- Timberlands — Capture maximum timber value from every acre we own or manage.
- Real Estate & ENR — Deliver premiums to timberland value by identifying and monetizing higher and better use lands and capturing the full value of surface and subsurface assets, including through our Climate Solutions business.
- Wood Products — Manufacture high-quality structural lumber, oriented strand board and engineered wood products, as well

as deliver complementary building products for residential, multi-family, industrial and light commercial applications at competitive costs.

INNOVATION AND OPERATIONAL EXCELLENCE

We are committed to driving innovation and operational excellence across all facets of our company. By leveraging cutting-edge technologies and fostering a culture of continuous improvement, Weyerhaeuser consistently improves reliability and safety, enhances its operational efficiency, mitigates disruption from external challenges and seizes new market opportunities. The company's relentless focus on innovation is evident in its strategic initiatives aimed at optimizing resource utilization, reducing costs and delivering superior value to our customers.

ENVIRONMENTAL, SOCIAL AND GOVERNANCE (ESG) PRACTICES

Sustainability has been one of the core values of our company for more than 100 years. We have spent decades building a solid foundation characterized by excellence in environmental stewardship, social responsibility and corporate governance. Maintaining a strong ESG foundation is a key component of our ability to drive long-term shareholder value, and these principles guide us in how we conduct our business every day.

ENVIRONMENTAL STEWARDSHIP

As a pioneer in sustainable forestry, we have environmental stewardship deeply rooted in our business and very much at the core of our company. To operate successfully, we need our forests to provide a sustainable supply of wood fiber now and long into the future. To ensure our forests remain healthy and valuable for decades to come, we protect and enhance the many additional benefits they provide, such as clean water, clean air and critical areas for biodiversity. We also enhance the environmental footprint in our wood products manufacturing business, including reducing air emissions, minimizing waste and maximizing wood recovery. These actions are prudent for our business, good for the environment and essential to how we run our operations sustainably.

PRACTICING SUSTAINABLE FORESTRY

As one of the world's oldest and largest private timberland owners, we've been growing, harvesting and regrowing forests for more than a century. We advocated for legislation in 1925 to encourage reforestation after harvest, which was an uncommon practice at the time. In 1937, we began research into sustainable yield forestry, which ensures harvesting does

not diminish a forest's ability to provide the same volume in the future. In 1938, we were one of the first companies to plant tree seedlings, and in 1941, we established the first certified tree farm in the U.S. We harvest, on average, only 2 percent of our forests each year, and 100 percent of our timberlands are reforested after harvesting. We plant more than 100 million tree seedlings per year, about 190 trees per minute throughout the year.

GREENHOUSE GAS INVENTORY

We remove substantially more carbon from the atmosphere than we emit each year.

In 2024, our scope 1 carbon emissions were 0.4 million metric tons of carbon dioxide equivalent (mtCO₂e), primarily attributable to fuel usage within our wood products mills and fertilizer application in our timberlands. Also in 2024, our location- and market-based scope 2 emissions were 0.4 million and 0.4 million mtCO₂e, respectively, which are emissions from the energy we purchase. Our scope 1 and scope 2 emissions are calculated in accordance with the Greenhouse Gas Protocol's Corporate Accounting and Reporting Standard. We obtained limited assurance of our 2024 scope 1 and scope 2 emissions from a third-party attestation provider.

In 2024, our scope 3 emissions totaled 9.0 million mtCO₂e, primarily generated by customers who purchase our wood fiber and the end-of-life emissions of the products we sell. Our scope 3 emissions are calculated in accordance with the Greenhouse Gas Protocol's Corporate Value Chain (Scope 3) Accounting and Reporting Standard.

Our sustainably managed forests play a critical role in helping to mitigate climate change. As our millions of acres of forests grow, they absorb carbon dioxide from the atmosphere and store it in their trunks, limbs and roots, as well as in the soil. In 2024, our direct carbon removals totaled 10 million mtCO₂e (the increase in above-ground carbon in our U.S. timberlands attributable to forest growth and management practices after we account for harvest and mortality). Also in 2024, the indirect carbon removals across our value chain were 27 million mtCO₂e (primarily carbon stored in our own long-lived wood products and products our customers make from our logs).

In 2024, our forests contained between 2.3 billion and 3.6 billion mtCO₂e. Approximately 1.0 billion mtCO₂e was stored in our trees and roots, and an additional 1.3 billion to 2.6 billion mtCO₂e was stored in soil and other biomass. After our trees are harvested, much of their carbon remains stored in the long-lived wood products made from them for the life of those products. After harvest, we plant millions of new trees, which then begin absorbing more CO₂ from the atmosphere, and the next round of wood products store more carbon yet again. Our

managed forests also provide other climate benefits. They mature more quickly and are able to bank more carbon through faster, continuous rotations, all while maintaining the vast pool of carbon in the forest soil. In addition, using wood for construction requires less energy and results in fewer greenhouse gas (GHG) emissions compared with other building materials, such as steel and concrete.

We have a near-term science-based GHG emissions reduction target that has been approved by the Science Based Targets initiative at the most ambitious level, in alignment with the Paris Agreement goal of limiting global warming to 1.5 degree Celsius. Our target includes a commitment to reduce our scope 1 and 2 emissions by 42 percent overall, and our scope 3 emissions by 25 percent per ton of production, both by 2030, measured against a 2020 baseline. We are also members of The Climate Pledge, a commitment to achieve net-zero carbon emissions across our value chain by 2040. We expect to achieve these targets primarily through energy efficiency projects, increased renewable energy usage and supplier engagement. As companies across our value chain actively work to reduce their emissions, with many already taking action or making commitments, we expect our scope 3 emissions to decrease over time.

MAKING BETTER ENERGY CHOICES

We are members of the U.S. Department of Energy's (DOE) Better Plants Program, which includes a goal to improve purchased energy efficiency at our manufacturing facilities by 10 percent between 2020 and 2030. This partnership requires us to adopt a companywide goal to improve energy efficiency, annually report our progress to the DOE and develop an energy management plan. We have a comprehensive wood products energy strategy that we are implementing by developing short-term action plans and evaluation tools at all sites. We also fully integrate GHG and energy metrics into capital planning processes and conduct energy audits at manufacturing sites. On average, we meet more than two-thirds of the energy needs in our manufacturing facilities by using by-products such as bark, sawdust, chips and shavings as fuel. This approach allows us to reduce our reliance on nonrenewable fossil fuels and purchased electricity. We also support other renewable energy solutions, such as wind and solar power, through our timberlands. In addition, we also supply other mills, companies and utilities with woody biomass that is used to produce renewable, low-carbon energy.

PROTECTING BIODIVERSITY

The forests we manage host hundreds of native vertebrate species, including large mammals such as deer, elk, cougar, black bear and bobcat, as well as a tremendous diversity of

birds, reptiles, amphibians, insects, native fish and other aquatic species. Many of these species prefer different forest age classes and forest structures, or other habitat features on the landscape, such as riparian areas. Since our timberlands contain a matrix of forest stand ages, along with other special areas we protect around streams and wetlands, these forests support a high level of native biodiversity. To preserve and protect this balance, we regularly conduct biodiversity assessments across our forests as part of our ongoing stewardship and forest management operations. These assessments include analyzing species occurrence data and assessing the presence of threatened, endangered, critically imperiled, imperiled and other regionally significant species. Conducting biodiversity assessments across our land base gives us necessary insights to help design and implement best practices for habitat conservation and species protection throughout the course of our forest management activities. These practices include leaving buffers along riparian areas, surveying sites for species occurrences prior to harvesting and thinning activities, managing for specific habitat using prescribed burns or thinning harvests and refraining from harvesting during certain sensitive times.

IMPROVING CONSERVATION OUTCOMES

Ensuring our forests provide habitat features that support at-risk, sensitive or threatened and endangered species is a core component of our environmental stewardship. We pursue several programs to create and preserve critical habitat, including partnering on conservation easements and agreements, formal Habitat Conservation Plans (HCPs) with the U.S. federal government and mitigation banking. Conservation easements and other local agreements can ensure sustainable forest practices and the long-term stewardship and protection of wildlife habitat, biodiversity and recreational access. These partnerships can be made with a variety of groups and organizations, and they allow natural resource management to continue, which helps protect the economic benefits of a working forest. We work with more than 20 different conservation partners across the U.S. to develop programs to expand public access, protect critical habitat and preserve sites of environmental, cultural and historical significance. HCPs are administered under the federal Endangered Species Act and help provide more specific guidance on the protection and enhancement of habitats for threatened and endangered species. We participate in more than 50 conservation agreements and collaborative efforts that address specific habitat needs of at-risk or sensitive species across our timberlands. Authorized through the U.S. Clean Water Act, mitigation banking allows us to set aside certain areas of our timberlands to preserve, enhance or restore a wetland, stream or habitat area to make up for development by another entity in

a similar nearby ecosystem. Mitigation banks are regulated and approved by the U.S. Army Corps of Engineers and a consortium of federal, state and local agencies. We currently operate 16 mitigation banks, primarily in the U.S. South. Several other banks and projects are in various stages of evaluation and development, and we are always looking for new opportunities and partnerships to expand our impact.

CONTRIBUTING TO CLEAN WATER

Our forests are critical for providing clean water to communities in our watersheds. The trees, plants and soil absorb rain and snowmelt, allowing our forests to capture and slowly release clean water into the many streams, rivers and groundwater systems on our lands. Our sustainable forestry practices help us maintain our forests' ability to capture and filter water, ensuring our harvesting methods safeguard water quality for people, fish and countless other organisms. Because our forests rely on rainwater to grow, our company's measurable impact on water use is limited to our Wood Products manufacturing sites and offices, where water is either recycled or treated on-site, evaporated while products are drying or delivered to a local, publicly-owned treatment facility.

MAKING THE MOST OF EVERY TREE WE HARVEST

We use nearly every part of every tree we harvest, and we always direct harvested logs and fiber to their highest-value use. The primary products we make are structural lumber, wood panels and engineered wood products. Forest and mill by-products such as wood shavings, sawdust, chips and bark are sold or delivered to downstream customers who make other products that are essential to everyday life, including toilet paper, diapers, paper, cartons, boxes, bags, landscaping mulch and wood pellets. We also use many of these by-products as fuel in our own wood products facilities to generate heat for processes such as drying lumber and curing plywood — ensuring that we have a steady supply of renewable energy. This approach means that, on average, 99 percent of our wood by-products are used to create other products or to generate energy.

VERIFYING WITH CERTIFICATION

To prove our forest management and wood fiber procurement practices are sustainable, we participate in independent certification programs for forest management, fiber sourcing and chain of custody. Our entire timberland portfolio is certified to the Sustainable Forestry Initiative® (SFI) Forest Management Standard. That compares with about 11 percent of the world's forests that are certified today (the vast majority of these certified forests are in the Northern Hemisphere). Internationally recognized forest certification standards, such
